STUDENT INFORMATION MANAGEMENT SYSTEM WITH MOODLE INTEGRATION

Developer Handoff and Supervisor Demonstration Guide

BY

CHARLES HANGOMA 2021414469

CHITUNDU MILIMBO 2020992574

A PROJECT REPORT PRESENTED FOR SUPERVISOR REVIEW TOWARDS THE REQUIREMENTS OF A BACHELOR OF SCIENCE IN COMPUTER SCIENCE DEGREE

THE UNIVERSITY OF ZAMBIA

Department of Computer Science

16 October 2026

OUR REVIEW GUIDE

We are Charles Hangoma and Chitundu Milimbo. We use this guide to exchange our work and help our supervisors run the same demonstration data. We keep our cloud credentials out of this copy and provide local review passwords instead.

Our contents

1 Our review setup

2 Our demonstration accounts and tasks

3 Our demonstration walkthrough

4 Our developer handoff packet

5 Our verification and acceptance record

1 OUR REVIEW SETUP

We install Docker Desktop with Compose on Windows/macOS, or Docker Engine with Compose on Linux. We extract the complete source ZIP and open a terminal in the folder containing compose.supervisor.yml. We keep our existing databases and ports separate from this review copy.

We run the following command from that folder:

docker compose -f compose.supervisor.yml up --build -d

We inspect startup with:

docker compose -f compose.supervisor.yml logs -f initialise prepare-workflows web

We wait until the web log says Ready, then open http://localhost:8088. We expect the initial build to download several hundred MB of free images and packages. We recommend 8 GB RAM and 5 GB free disk space. We do not require a MoodleCloud token for the local simulator.

We prepare four engineering participants, twelve course titles, nine formal registrations and thirty-six course registrations. We prepare a separate registered timetable learner and twelve-session master for independent publication. We preserve an existing review plan or publication history when restarting.

How we stop and restart

We run docker compose -f compose.supervisor.yml stop to pause the copy and docker compose -f compose.supervisor.yml up -d to resume it. We retain data in dedicated review volumes. We do not remove volumes when preserving a supervisor’s review work.

How we recover a startup failure

We inspect docker compose -f compose.supervisor.yml logs --tail=80. We check that Docker is running, the initial downloads completed and ports 8088/8089 are free. We can set SIS_SUPERVISOR_WEB_PORT or SIS_SUPERVISOR_API_PORT before starting if another application uses them. We preserve the current records when a preparation command reports a different course plan.

2 OUR DEMONSTRATION ACCOUNTS AND TASKS

Our local review accounts

Username	**Local password**	**What we explore**
sis.demo.chanda.mulenga	Review-2026-Chanda!	inspect registration, studies, finance and the student sidebar.
sis.demo.bwalya.mwansa	Review-2026-Bwalya!	compare a second student account and owned records.
sis.demo.mutale.banda	Review-2026-Mutale!	compare a third student account and owned records.
sis.demo.nasilele.tembo	Review-2026-Nasilele!	inspect the generated engineering teaching account.
bwalya.m	Seed-2026-Bwalya	start an application and upload the bundled practice PDF.
temwani.r	Seed-2026-Temwani	review assigned admissions work.
chisenga.l	Seed-2026-Chisenga	inspect assessment plans and the lecturer workspace.
mumba.s	Seed-2026-Mumba	inspect Moodle administration and mappings.
mweene.t	Seed-2026-Mweene	inspect access reviews and role assignments.
nasilele.master	Seed-2026-Master	inspect the master timetable and save drafts.
tembo.timetable	Seed-2026-Timetable	independently review and publish the prepared timetable.
chanda.time	Seed-2026-Student	inspect the published student timetable after review.

We use these passwords only in our isolated review dataset. We do not include the MoodleCloud API token, external account passwords or a cloud database dump. We retain the same participant names and course catalogue while keeping each environment’s credentials separate.

3 OUR DEMONSTRATION WALKTHROUGH

3.1 Student registration and information

We sign in as sis.demo.chanda.mulenga with Review-2026-Chanda!. We expect direct entry to the student portal. We inspect the sidebar, account area, study context and information cards. We open My studies and change between the prepared study blocks. We compare the registered course list with the source preparation receipt.

3.2 Independent timetable publication

We sign in as nasilele.master with Seed-2026-Master, open Timetable publication and inspect DEMO-2026-PUBLICATION. We view the master and individual course previews. We retain the pending publication so that an independent reviewer performs the decision.

We sign in as tembo.timetable with Seed-2026-Timetable, inspect the same master/source and approve it through the review page. We then sign in as chanda.time with Seed-2026-Student and select the demonstration period. We open the relevant October 2026 teaching week and inspect week, day and list views. We keep the publication receipt as evidence.

3.3 Application documents

We sign in as bwalya.m with Seed-2026-Bwalya. We complete our qualifications and use the Supporting documents practice-document link to upload the bundled PDF. We observe upload progress, scan status and specific validation messages. We review the application before submission. Our local scanner accepts only the exact bundled practice file; we do not treat an arbitrary file as already approved.

3.4 Staff assessment and Moodle

We use chisenga.l for assessment-plan drafting and mumba.s for Moodle mappings and validation. We use Switch workspace deliberately when another active appointment is available. We keep plan drafting, independent approval and official publication as distinct actions. We inspect simulator state locally; we do not claim that the local copy has our cloud token.

4 OUR DEVELOPER HANDOFF PACKET

4.1 Charles hands the student portal to Chitundu

I am Charles. I prepare the student sidebar, context-aware home and timetable cards, UI-011 task packet, source and review dataset. I ask Chitundu to check desktop/mobile scrolling, the pinned account, keyboard focus, study-period preservation, pending/published timetable and error recovery. I attach actual test and image evidence; I do not fill in Chitundu's acceptance.

4.2 Chitundu hands sign in and switching to Charles

I am Chitundu. I prepare UI-012, exact role landing and valid selected-context retention. I ask Charles to check student, lecturer and administrator entry, explicit workspace switching, expired authority, no-active recovery, foreign account refusal and safe return links. I attach connected allow/deny evidence and leave Charles's review decision open.

4.3 Charles hands timetable publication to Chitundu

I am Charles. I prepare the registered source learner and the master as the drafter. I ask Chitundu to use the independent reviewer account, inspect the source/version, publish deliberately and verify the learner timetable and notices. We retain the resulting receipt and history.

4.4 Chitundu hands the Moodle foundation to Charles

I am Chitundu. I hand over the scope helpers, run contract and documented lifecycle corrections. I mark the persisted service, verified password receipts, independent approvals and durable live delivery as unfinished. I ask Charles to preserve the existing live gate until the connected lifecycle and recovery evidence are complete.

4.5 Our completion checks

Our handoff closure checks

Our check	**What we retain**
We trace the requirement	Exact handbook record, task packet and decision note
We explain the workflow	UI, API, data owner, audit and recovery behavior
We verify both outcomes	Normal, denial, conflict, stale version and retry evidence
We review the interface	Keyboard, contrast, mobile layout and meaningful status
We preserve partner work	Named worktree and explicit file staging
We publish the checkpoint	Verified commit, CI, migration and deployment receipt
We accept it ourselves	Named developer review and supervisor comments

5 OUR VERIFICATION AND ACCEPTANCE RECORD

We fill in this record after our own walkthrough. We do not treat automated output as either developer's signature or supervisor approval.

I implemented or revised _____

I received the handoff as _____

I checked commit or source manifest _____

I ran these workflows _____

I observed these defects _____

I recorded this decision and date _____

Our supervisor commented _____

We use the accompanying progress report to see remaining workflow families and evidence boundaries. We keep our current runnable source distinct from the unfinished Moodle run foundation worktree.
